

MOVE & Patient Lists 1.4.0 and NoteAssist 1.4.0

Performance and stability improvements required by CareVue 2018.2.0

This release includes performance and stability improvements that are required when running CareVue 2018.2.0.

Changes to Provider List Source

This version of MOVE & Patient Lists changes how the Provider list source qualifies patients with consults for inclusion on patient lists. Previously, patients with any active, pending or completed consults qualified for inclusion until the patient was discharged; now, qualification is limited to active or pending consults. This change works in conjunction with other CareVue changes that allow providers to administratively complete a consult from the Provider Dashboard, after which that patient “falls off” the list if there are no other qualifying characteristics.

Larger ePEHR Reports

This version of NoteAssist includes better memory management, enabling larger ePEHR reports that do not generate memory errors.

Required action:

In MOVE, create a Provider list source based on a consulting relationship. Ensure that patients appear on that list when consults are in an active and pending status. Alternatively, for clients using Provider/Clinical Dashboards, test with artifact 22505 to ensure that only patients with active and pending consults are included in patient lists.

Run the ePEHR for any patients that previously encountered a memory error.
