

## *MOVE & Patient Lists 1.3.8 and NoteAssist 1.3.8*

### ***Performance and stability improvements***

This release includes performance and stability improvements that should be run with CareVue 2018.1.8 or subsequent versions in the 2018.1.x series.

This version of NoteAssist also supports the use case in which a cosigner edits an already signed note and the obfuscated SIGNATURE BLOCK NAME of SIGNATURE BLOCK TITLE option includes an up-caret (^) character.

### **Required actions:**

For clients using Provider/Clinical Dashboards and the ePEHR, test in your normal workflows that include those functionalities.

For clients using NoteAssist notes with cosigning workflows:

- Create and sign a NoteAssist note by a user who requires a co-signer.
- As the co-signer, edit the note, which obfuscates the author's signature block name and title. The obfuscation does not always produce a name or title with the ^ character, but if it does, ensure that the note can be further edited in CareVue.
